

Maintenance Controller

**Client**

Britannia Operator Ltd (BOL)

Duration

1998- Present

The Britannia gas-condensate field development is one of the largest and most significant ever undertaken in the UK.

Chevron UK Ltd. and Conoco (UK) Ltd. established a separate company, Britannia Operator Ltd. (BOL), to act as operator of the field. Britannia plays a key role in meeting the UK's need for primary energy from indigenous sources.

In achieving its objective to be the lowest cost operator in The North Sea, BOL required an IT System to manage the maintenance on the platform. A thorough evaluation process was undertaken after which ESBI

Computing's Maintenance Controller was selected.

From the earliest days of the Britannia project BOL defined a series of milestones against which the operation of the platform was assessed. Maintenance Controller (MC) has played a substantial role in achieving some of these milestones.

Services

- Product enhancement, installation and configuration
- Assistance in data conversion.
- Integration of MC with a number of BOL's other corporate systems
- Training for both management and users
- Ongoing support
